1. Schedule — Key Dates & Deadlines

Phase	Date & Time (PDT)	What Happens
Kick-off Meeting	June 10, 11:30 a.m. – 12:15 p.m.	Onboarding, problem reveal, live demo

Build-It phase	June 10, 12:30 – 5:30 p.m. PDT · remote	Write your <code>stor</code> implementation in C, push code, get it built & scored
Code submission deadline	June 10 at 5:30 p.m.	Last chance to push a passing build — after this, no more Build-It submissions
Break-It phase	June 11, 2:00 – 5:00 p.m. PDT · Meeting Room 3	All qualifying source code is released; find and submit exploits against other teams

The deadlines are hard. Pushes after the Build-It deadline will **not** be scored as build submissions, and break submissions after the Break-It window closes will **not** count. Plan ahead and submit early.

2. Logging In & Your Profile

- Go to <https://hpen-bibi.com> and click **Log In** in the top navigation bar.
- Enter the **username** and **password** you chose during registration.
- Once logged in, you'll see your username in the navigation bar. Click it to access your **profile/account** page.

3. Getting Set Up (Registration, Teams, Webhook)

For the full step-by-step walkthrough — registration, email verification, creating or joining a team, and wiring up your GitHub webhook — see **01-onboarding.md**.

The short version: register at <https://hpen-bibi.com> with the same email you put in the Google Form, verify it, create/join a team, and add the push webhook from the leader's email. Once your first push shows up as a Build Submission on the dashboard, you're good to go.

4. Viewing Your Build Submissions

BuildBuildFail

Your code either **failed to compile** or **failed one or more required functionality tests**. Check the details to see what went wrong.

Only the **latest** `BuildBuilt` submission counts for scoring and for Break-It qualification. Keep pushing improvements — each new push replaces the previous one.

6. Viewing Build Submission Details

Where to find them

- On your **Build Submissions** list, click on a specific submission to expand or view its detail page.
- The detail view shows:
 - **Build log** — compiler output, any errors or warnings.
 - **Test results** — which functionality tests passed or failed (listed individually).
 - **Status** — the overall result (`BuildBuilt` or `BuildBuildFail`).

What to look for if your build failed

1. **Compilation errors** — check the build log for `gcc` errors.
2. **Test failures** — check which specific test cases failed and what the expected vs. actual output was.
3. **Timeout** — if the build or any individual test took too long (per-test limit: 60 seconds; full session limit: 60 minutes).

7. The Scoreboard

Where to find it

- Click **Scoreboard** (or **Leaderboard**) in the top navigation bar of the dashboard.
- You're shown **two boards**:
 - **Builder Board** — ranks teams by their Build-It score (250 baseline – bugs suffered in Break-It).
 - **Breaker Board** — ranks teams by their Break-It score (bugs found in other teams' code).
- **Prizes** are awarded on the **Overall** standing = **Builder total + Breaker total** (top 3). The two boards are shown separately so you can see each result, but they **combine** for the prize ranking.

What the scores mean

- **Build score = 250, flat.** Pass **all required functionality tests** → 250 (all-or-nothing). There are **no optional-test or performance points** this event, so every qualifying team starts at 250 and Break-It is what separates teams.
- **Break score** = points earned from valid break submissions against other teams.
- **Builder total** = build – break losses · **Breaker total** = break points · **Overall (prizes)** = Builder + Breaker.

When does it update?

- Scores update after each submission is processed. The scoreboard reflects the **latest scored state**.
- During Build-It, your build score updates with each successful build.
- During Break-It, scores shift as teams submit valid exploits.

8. Break-It: Viewing Break Submissions Against Your Team

Where to find them

- Navigate to your **Team** page on the dashboard.
- Look for the **Break Submissions** or **Breaks Against You** section.
- This lists all break attempts other teams have submitted targeting **your** code.

What you'll see for each break

- **Attacking team** — who submitted it (team name or ID).
- **Category** — `correctness` (25 pts), `crash` (50 pts), or `integrity/confidentiality/security` (100 pts each).
- **Status** — whether the break was judged **valid** or **invalid** by the automated grader.
- **Timestamp** — when it was submitted.

What this means for your score

- Each **valid** break against you **deducts** points from your Builder score (`correctness` 25, `crash` 50, `security` 100).
- **No time-weighting** — when in the round a break lands doesn't change its value.
- The **live board is provisional** and shows each break in full. In the **final standings**, a bug found by several teams is consolidated (counts once, its points shared among the finders), so your final score may differ — usually better for builders.

9. Break-It: Submitting Breaks & Scoring

For the full break submission format (`test.json` schema, categories, rules) see **02-problem-statement.md**, Section 5. For scoring details (point values, duplicate-aware splitting in the final standings, tiebreakers) see **04-scoring.md**. For the repo layout (`build/` and `break/` folders) see **00-quickstart-cheatsheet.md**.

Where to see your submitted breaks on the dashboard

- On your **Team** page, look for **Your Break Submissions** or **Breaks You Submitted** — this shows all your outgoing breaks, their target team, category, and whether they were accepted as valid.

Quick reminders

- Breaks are submitted **via Git push** — create a folder under `break/` with `test.json` + `description.txt`, then push.
 - The system only picks up **new or modified** `test.json` files — touching only `description.txt` won't trigger a re-grade.
 - Find the **target team's numeric ID** on the dashboard/scoreboard and use it in your `test.json`.
 - There are **no penalties** for invalid break attempts.
-

10. Frequently Asked Questions (FAQ)

Registration & Teams

Q: I registered but can't create or join a team. A: You haven't verified your email yet. Check your inbox (and spam) for the verification link and click it.

Q: Can I change my team after joining one? A: Talk to an organizer — team changes after sign-up may need manual help.

Q: Who should create the team? A: The teammate who filled out the Google Form (the one whose GitHub repo link we have). They become the team leader and receive the webhook email.

Q: How many people can be on a team? A: 1–3 participants per team.

Build-It

Q: I pushed code but nothing happened on the dashboard. A: Check that your webhook is set up correctly (push event, correct Payload URL + Secret, `application/json`). If your repo is private, make sure `hpe-bibi-runner` is added as a collaborator.

Q: My build says BuildBuildFail — what went wrong? A: Click on the submission to see details. Common issues:

- Compilation errors (check your `gcc` flags).
- No `Makefile` in `build/`, or `make` doesn't produce `./stor`.
- A required functionality test failed.
- You used a library not available in the sandbox image.

Q: Can I submit multiple times? A: Yes! Every push triggers a new build. Only your **latest passing build** is used for scoring and Break-It.

Q: What compiler flags are required? A: `-O0 -g -m32 -fno-stack-protector` plus `execstack`. These are required — do not remove them.

Q: What happens if my build times out? A: Each test has a 60-second limit and the full session has a 60-minute limit. If exceeded, the build fails.

Break-It

Q: Where do I get the other teams' source code and binaries? A: After Build-It ends and the Break-It phase begins, organizers publish **break packages** for each qualifying team. These contain the target's source code, compiled binary, and `enc.db`. Check the dashboard for download links.

Q: What's the target team ID? Where do I find it? A: Each team has a **numeric ID** visible on the dashboard/scoreboard. Use this in your `test.json` as `target_team`.

Q: I submitted a break but it was marked invalid — why? A: The grader recompiles the target's source and reruns your exploit. Possible reasons:

- Your test doesn't actually trigger the bug (it passes without error).
- Missing `description.txt`.
- Wrong `target_team` ID.
- The commands in `test.json` don't reproduce the issue.

Q: Is there a penalty for submitting invalid breaks? A: No. There is **no penalty** for incorrect attempts, but they don't earn points either.

Q: I only modified `description.txt` but my break didn't update. A: The system only registers a break when `test.json` is **added or modified**. Touching only `description.txt` won't trigger a re-grade.

Q: Can I submit breaks against my own team? A: No — self-attacks are not valid.

Scoring & Scoreboard

Q: Why is my build score showing nothing? A: You haven't passed **all required functionality tests** yet. Until you do, your build score is NULL and you're not ranked.

Q: The scoreboard shows a different number than I expected. A: The live board is **provisional** — it shows every break at full value. In the **final standings** a bug found by several teams is consolidated (counts once, its points shared among the finders), so numbers can shift after the round. There is **no time-weighting**.

Q: When do scores finalize? A: After the Break-It phase ends and all pending submissions are graded.

11. Troubleshooting

Symptom	Likely Cause	Fix
"Email not recognized" at registration	Email not allowlisted, or doesn't match the Google Form	Use the exact email from the form; ask an organizer to re-check
Can't create/join a team	Email not verified	Click the verification link in your inbox
No webhook email	Team not created yet, or form-filler didn't create the team	The webhook email goes to the team leader — make sure the right person created the team

Push doesn't trigger a build	Webhook misconfigured	Verify: Payload URL, Secret, Content type = <code>application/json</code> , subscribed to <i>push</i> event, webhook is Active
Push doesn't trigger a build (private repo)	Bot not added	Add hpe-bibi-runner as a read collaborator on your GitHub repo
Build fails unexpectedly	Code depends on local environment	Test inside the Docker container (<code>docker build --tag bibifi . && docker run --rm -it bibifi</code>)
No verification email	—	Check spam; confirm email matches the form; ask an organizer
Break submission not appearing	Only pushed <code>description.txt</code>	You must add or modify test.json for the system to register the break

Still stuck? Ask in the **contest Slack** — [join here](#). It's the support + resources hub, especially during the **remote Build-It** day; on **Break-It** day (Meeting Room 3) you can also raise your hand. Don't waste contest time on setup issues!
